Team: Alexa White and Justin Morgan

<u>To Run:</u>

go build mr/mr.go
go build rf/*.go
go build -buildmode=plugin wc.go
go build main.go worker.go fmanager.go
./main input_files/pg-metamorphosis.txt wc.so

Output is stored in directory "output_files"
After some number of the tasks have been completed, the master node is killed
and restarted by main to simulate failure. It then initializes itself from the
replicated log and continues from the point of failure. To simulate worker failure,
nodes 3 and 5 are set to return from assigned tasks without completing. The
master will detect this failure and re-assign their tasks to other nodes.

<u>To compare output to sequential:</u>

(output files concatenated into new file mr-out-0 and compared with sequential
result)

go build mrsequential.go
./mrsequential wc.so ./input_files/pg-metamorphosis.txt
diff mr-out-0 mr-seq-out-0
